Name: _____ Date: _____

Read the text and respond.

Coral Reefs: Homes in the Ocean

Coral reefs are amazing underwater structures found in warm, tropical waters. The reefs are made up of the skeletons of huge numbers of coral polyps that look like plants, but are tiny animals. When the polyps die, living polyps grow on the top of their skeletons, and the reef grows.

Because of the food and shelter they provide, coral reefs are home to thousands of sea creatures. These marine creatures and plants work together to survive. However, reefs are fragile. Water that is too warm or polluted harms the reef and causes the marine life to die. People walking on reefs at low tide can also damage reefs. Coral reefs around the world are in danger. They must be protected.

1. Multiple Choice

What is the effect of warmer water and pollution on coral reefs? (Circle the letter for the correct answer.)

- A. Coral reefs grow faster.
- B. Coral is damaged and marine animals may lose their homes.
- C. The ocean becomes colder.
- D. More animals move into the reef.

2. Written Response

Coral reefs are homes to many sea creatures. In your writing:

- Explain the effect of pollution on coral reefs.
- Explain the effect of humans on coral reefs.
- Provide one way humans can protect coral reefs.
